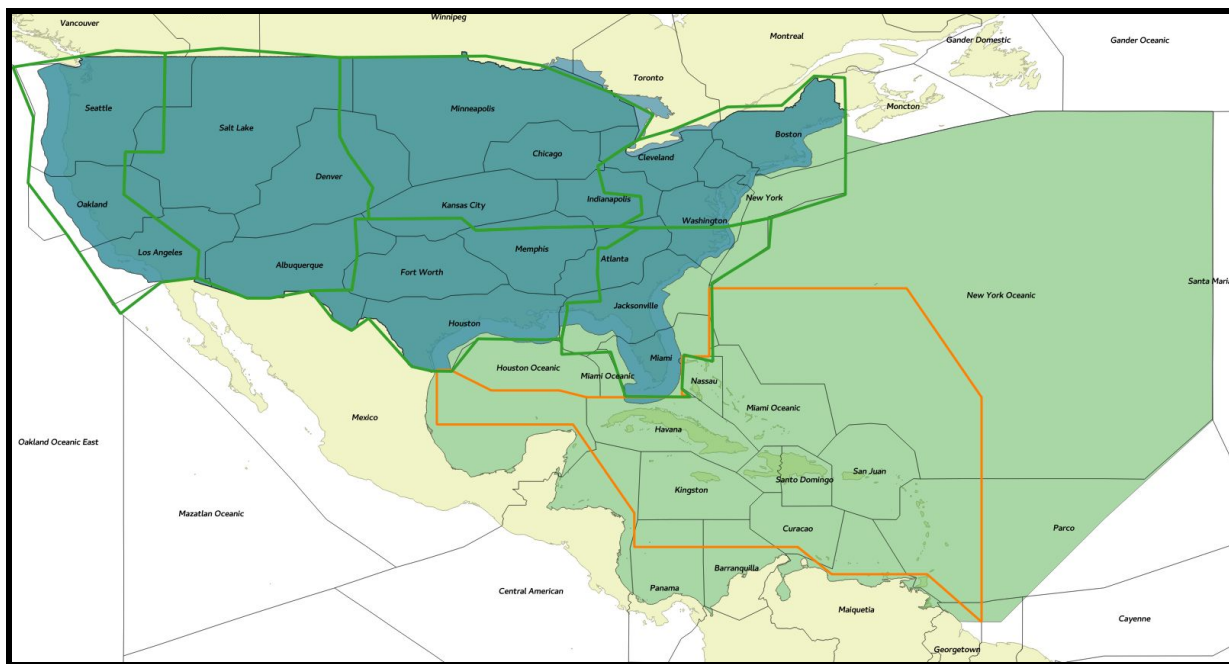

## Graphical Forecasts for Aviation

### Expansion to the Gulf of Mexico, Caribbean, and Atlantic Ocean

June 20, 2019

#### Part 1 – Mission Connection

**1. Product Description:** The operational Graphical Forecasts for Aviation (GFA) are a set of web-based displays that provide observations and forecasts of weather phenomena critical for aviation safety. This product covers the continental United States (CONUS) from the surface up to Flight Level 480 (FL480) or approximately 48,000 ft. above Mean Sea Level (MSL). The expansion covers the United States controlled airspace and Flight Information Regions (FIRs) for which the Aviation Weather Center (AWC) has current area forecast responsibilities in the Gulf of Mexico, Caribbean, and portions of the Atlantic Ocean (see Fig. 1).

*Fig 1. Domain of the operational GFA for the CONUS (blue fill) and the expansion area (green fill). AWC has current area forecast responsibilities in the area delineated by the orange outline. The green outline delineates areas which the CONUS text area forecasts have been discontinued.*

Wind, icing and turbulence forecasts are available in 3,000 ft. increments from the surface up to FL180 (18,000 ft. MSL), and in 6,000 ft. increments from FL180 to FL480. Turbulence forecasts are also broken into LO (below FL180) and HI (FL180 and above) graphics. A

maximum icing graphic and maximum wind velocity graphic (regardless of altitude) are also available.

Multiple fields of interest are combined in categories that the user can select from the top of the display. Data are time synchronized and available hourly from the previous 14 hours to present (now) on the *Observations/Warnings* tab, and from 1 to 15 hours in the future (+1 to +15 hours) in the *Forecasts* category. The data for each category is determined by the time period: Observations & Warnings (current time and the previous 14 hours) and Forecasts (valid up to 15 hours in the future). Details of each category are in the following table:

Category	Layer	Data Displayed
Observations & Warnings	METARs	Station Model METARs; SIGMETs; all NWS Warnings impacting aviation; Satellite/Radar  (-14 hours to Now)
Observations & Warnings	Precipitation/Weather	Weather Symbols; Convective SIGMETs; tropical cyclone, tornado, severe thunderstorm, winter storm, freezing rain, ice, and lake effect snow warnings; Satellite/Radar  (-14 hours to Now)
Observations & Warnings	Ceiling/Visibility	Flight Category symbol/number; Convective SIGMETs; tropical cyclone warnings; blowing dust, blowing sand and volcanic ash SIGMETs; winter storm, blizzard, blowing dust warnings; dense fog/freezing fog/marine dense fog advisories; Satellite/Radar  (-14 hours to Now with selector for FLT CAT, CIG, VIS)
Observations & Warnings	PIREPs	PIREPs; all SIGMETs; Satellite/Radar  (-14 hours to Now with vertical slider)
Observations & Warnings	Radar/Satellite	Radar/Satellite; all SIGMETs; all NWS warnings impacting aviation  (-14 hours to Now)

Forecasts	TAFs	Station Model TAFs; all SIGMETs; all NWS warnings impacting aviation  (+1 to +15 hours)
Forecasts	Ceiling/Visibility	Model derived Flight Category; ceiling & visibility with weather overlay including NDFD precipitation/weather type/intensity; IFR AIRMETs; Convective SIGMETs; tropical cyclone warnings; blowing dust, blowing sand, and volcanic ash SIGMETs; winter storm, blizzard, and blowing dust warnings; dense fog/freezing fog/marine dense fog advisories  (+1 to +15 hours with selector for FLT CAT, CIG, VIS)
Forecasts	Clouds	Model derived Clouds Coverage, Bases, and Tops; mountain obscuration AIRMETs; Convective SIGMETs; tropical cyclone warnings; volcanic ash SIGMETs  (+1 to +15 hours with selector for TOPS/COV/BASE)
Forecasts	Precipitation/Weather	NDFD or model derived Precipitation Type/Chance/Intensity; NDFD or model derived Weather; Convective SIGMETs; tropical cyclone warnings; volcanic ash SIGMETs; tornado, severe thunderstorm, winter storm, ice, freezing rain, and lake effect snow warnings  (+1 to +15 hours)
Forecasts	Thunderstorms	NDFD or model derived Thunderstorms Coverage/Type/Intensity; Convective SIGMETs; tropical cyclone warnings; tornado and severe thunderstorm warnings  (+1 to +15 hours)
Forecasts	Winds	NDFD or model derived Wind Speed and Gust; low level wind shear and strong surface wind AIRMETs; Convective SIGMETs; tropical

		cyclone warnings; gale, high wind, lake wind, winter storm, blizzard, ice, storm, and blowing dust warnings (+1 to +15 hours; vertical slider)
Forecasts	Turbulence	Graphical Turbulence Guidance; turbulence AIRMETs; turbulence SIGMETs (+1 to +15 hours with vertical slider)
Forecasts	Ice	FIP; NDFD or model derived Winter Precipitation/Weather Type/Chance/Intensity; Icing AIRMETs; Icing SIGMETs; winter storm, blizzard, lake effect snow warnings; freezing fog advisories (+1 to +15 hours with vertical slider)

Some datasets such as NDFD, AIRMETs, radar, and NWS issued warnings are only available for the CONUS and US territories. AIRMETs are only available from the current time to between +6 and +12 hours. Where not available, NDFD is replaced with model derived data. Convective SIGMETs are only issued for the CONUS, however, SIGMETs for Thunderstorms are available in non-CONUS locations.

Additional information is available in text format when mouse-clicking on the map or using the hover function. The “Settings” menu enables the user to customize the display, including the base map selection, specific data displayed, and map opacity, scales, and density. Overlays include airports, heliports, runways, jet routes, airways, airspace, Air Route Traffic Control Center (ARTCC)/Flight Information Region (FIR) boundaries, Navigational Aids (NAVAIDs), aviation point fixes, highways, roads, counties, and rivers for the CONUS. More detail is also revealed as you zoom in and individual layers can be turned on or off independently.

In addition to the graphical display, static images are also available on Lambert-Conformal Conic projections for the CONUS. These images are issued daily every three hours, beginning at 00 UTC, and provide information on clouds, visibility, surface winds, precipitation, and weather as summarized in this table:

Static Image	Weather Grid	Weather Overlay
Clouds	RAP Cloud Coverage	Model derived Cloud Base, Layers, Tops

Visibility, Surface Winds, Precipitation, and Weather	LAMP visibility	NDFD or model derived Wind Speed & Gusts; NDFD or model derived Precipitation/Weather Type/Intensity
---	-----------------	--

**2. Purpose/Intended Use:** Since the GFA provide equivalent meteorological information in-support of aviation, the National Weather Service, per request from the Federal Aviation Administration (FAA), ceased production of text CONUS Area Forecasts (FAs) on October 10, 2017. Transitioning to more-modern digital and graphical forecasts allows the AWC to focus the efforts of forecasters on maximizing operational benefit to aviation end users, resulting in improved weather information to decision-makers. The Aviation Weather Center continues to provide text Area Forecasts for the Gulf of Mexico, Caribbean, and portions of the Atlantic Ocean. The expansion of the GFA to these regions is intended to replace these text FAs upon completion of a formal product termination review and notification process.

The FAA, pursuant to Title 49 United States Code Section 44720, established requirements for this weather information and service which is necessary for the safe and efficient conduct of operations in the National Airspace System (NAS).

**3. Audience/Users:** Commercial and General Aviation pilots, operators, briefers and dispatchers.

**4. Presentation Format:** The GFA contain multiple displays of weather phenomena combined in a single interactive online domain, with the additional option to view static imagery. Overlays include airports, heliports, runways, jet routes, airways, airspace, ARTCC/FIR boundaries, NAVAIDs, aviation point fixes, highways, roads, counties, and rivers for the CONUS, Gulf of Mexico, Caribbean, and portions of the Atlantic Ocean.

**5. Feedback Method/Period:** For further information or to provide feedback, please contact:

Jonathan Leffler

## Part 2 – Technical Description

**1. Format and Science Basis:** The GFA combine OpenLayers displays of multiple weather parameters on a single website, with the additional option to view static imagery. The graphical display itself is not a weather product; it is a repository that aggregates a number of existing weather products into a single, quick-glance, automated display. Underlying products, except cloud and flight category data, have gone through a safety risk management process. These

various graphics are overlaid on high-resolution base-maps and can be selected from the “Settings” menu. The OpenLayers environment also offers more core functionality and support for mobile devices.

**2. Training:** A tutorial is available at <https://www.aviationweather.gov/gfa/help?page=tutorial>

**3. Availability:** The GFA Expansion to the Gulf of Mexico, Caribbean, and Atlantic Ocean is available at: <https://www.aviationweather.gov/gfa>

**4. Additional Information:** N/A
